

Super SMPTE System

Part #FIBR01

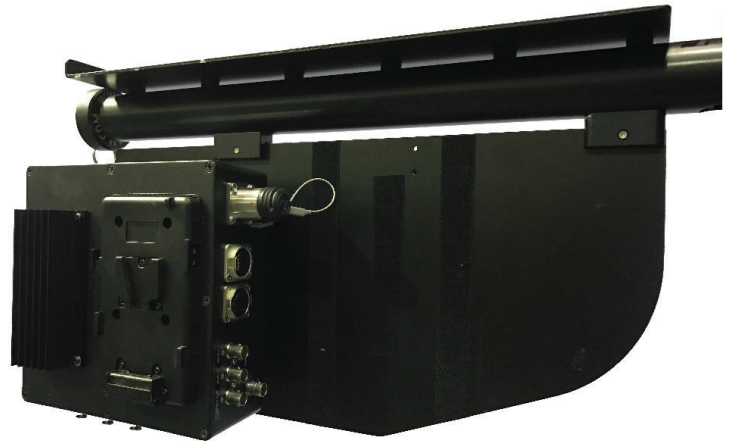

This is a Polecam friendly fibre system that mounts to the right hand side V-mount battery plate on the back of the Polecam.

It has been designed to be multi-functional for cameras such as the Antelope Pico, CIS and the Toshiba cameras.

It allows two 3G-HD signals to be sent back to the truck with bi-directional RS-232/422/485* data. A return 3G-HD signal for programme return, as well as 4x balanced audio channels.

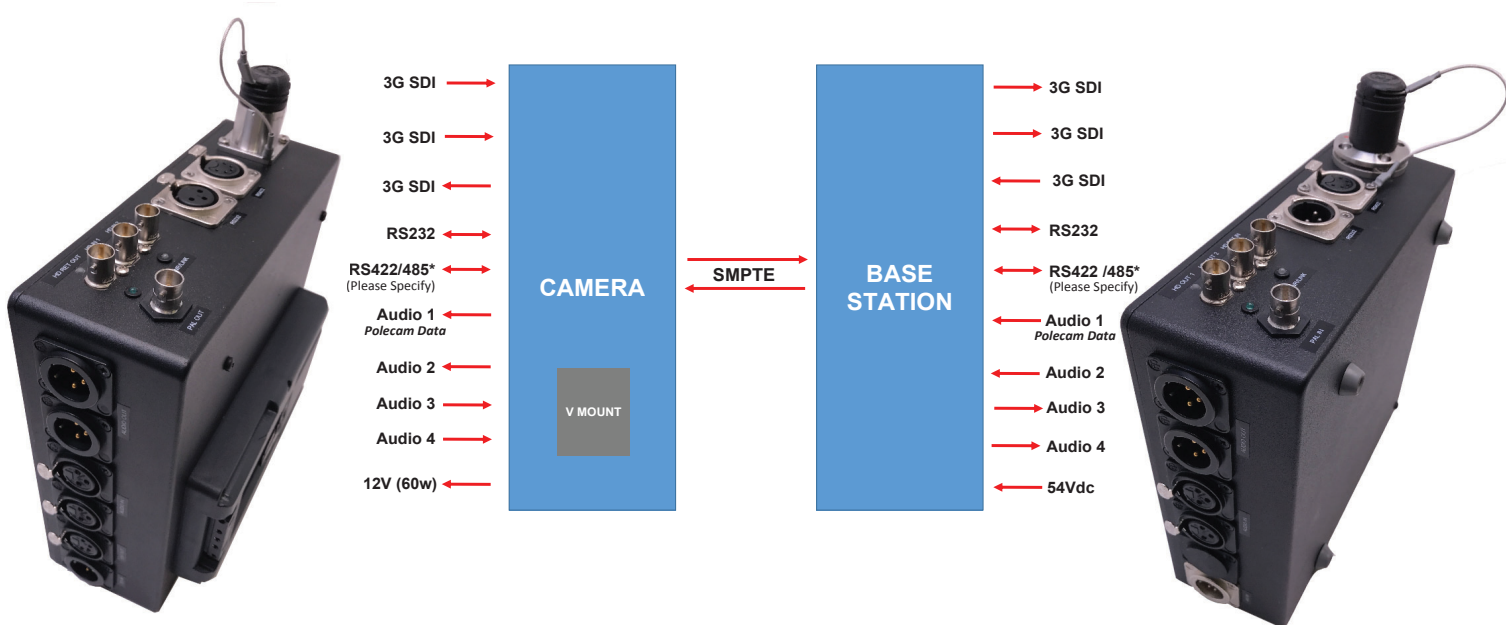

There is also 60W of power available, all down the one SMPTE cable. Power can run down SMPTE for up to 200m and 10km without power.

Indicator lights for video, power and SMPTE cable connection make trouble shooting much easier. This makes integrating into an OB much simpler and easier for all concerned

- Super SMPTE Camera system shown above on the Polecam Starter Pack Plus (PSP+) backend section. Located using the Polecam V-lock battery mounts which are fitted as standard to all PSP+ and Pro Packs (PPP) systems

Configuration schematic

* RS422 is supplied as standard, should RS485 be required, then please specify at time of order
